

## From Product Support

### Question

**What is the difference between Transfer Factor & Transfer Factor PLUS?**

### Answer from Product support:

4Life Transfer Factor Classic - Contains only those transfer factors obtained from cow colostrum. This formula was kept as an alternative for those people with concerns about allergies to egg yolks. There is also a large base of users who have had many years of success with this product.

4Life Transfer Factor Advanced Formula - The advanced formulas contain transfer factors derived from both cow colostrum and chicken egg yolks, called Transfer Factor E-XF. This combination of transfer factors was found to have synergistic activity in stimulating Natural Killer cell activity in a recent study. This product serves as an excellent daily education for your immune system without providing direct stimulation. It is safe for use by persons with overactive immune function, such as autoimmune conditions.

4Life Transfer Factor Plus Advanced Formula - This formula is our most potent immune support product. It combines the synergistic power of the Transfer Factor E-XF blend and the immune enhancing properties of the Cordyvant polysaccharide blend. This combines the education power of transfer factors with the well-documented immune modulating effects of Japanese mushrooms, Cordyceps, IP-6, beta-glucans and zinc. Those with a need for the strongest immune support will benefit the most from this product.

We recommend TF Classic for those with egg allergies or sensitivities to the "Plus" components. TF Advanced for most people and TF Plus for those needing the strongest immune support available (i.e. those with illness or who expect to be exposed to illness).
